Statement V

Suggested Color Code for Natural Gas Plastic Pipe Outside of Buildings

Originally Published January 2003

Background

Currently, there is no “standardized” color code for the plastic pipe industry. The purpose for this color code for solid wall pipe is to primarily identify the intended end-use application of **fuel gas (methane or propane)** piping. This color code is only intended for solid wall pipe – it is not intended for corrugated or other profile pipe. This PPI color code provides standardization for yellow or yellow stripe plastic pipe used in fuel gas applications. Plastic pipe manufacturers are requested to not use yellow or yellow colored stripes for other piping applications.

Proposed Color Code

<u>Color</u>	<u>Piping Application</u>
Yellow or yellow stripe	ONLY for fuel gas (methane or propane) applications
All other colors or colored stripes	All other applications such as water, cable, conduit, irrigation, slurry, sewer and drain applications
